
12 workload families x 3 seeds, 240 s traces, 30 s windows. Leave-one-family-out, scores pooled; bands are 95% CIs bootstrapped over FAMILIES.
Controls: shuffled labels 0.475 (must be 0.5); volume features alone 0.457 (the population is genuinely hard). One family is worth 0.083 of AUC — that is the study's resolution.
